SQUARE ENIX STORE – SEARCH, ACCOUNT, CART, AND CHECKOUT TESTING

Testing Purpose: This mock test document outlines positive scenarios, negative scenarios, edge cases, and visibility/usability checks for a Square Enix e-commerce style project. The goal is to validate core user flows such as product search, account creation, cart updates, navigation, and checkout behavior.

Application Under Test: Square Enix Store

Test Type

- Functional Testing
- Negative Testing
- Edge Case Testing
- UI/Visibility Testing
- Basic Responsive Testing

Test Focus Areas

- Product search
- Account registration and login validation
- Cart quantity management
- Homepage navigation
- Account detail access
- Checkout flow stability
- Error handling and validation messaging
- Cart readability and mobile responsiveness

Scope

This testing effort focuses on the following areas:

- Product search
- Quantity updates in cart
- Account creation
- Homepage navigation to product categories
- Account detail viewing
- Login validation
- Checkout stability
- Visibility and responsiveness checks

Test Cases

Test ID	Test Scenario	Preqs	Test Steps	Expected Result	Priority
TC-01	Search valid product name	User on homepage	Enter valid product → click search	Correct products display	High
TC-02	Update quantity	Item in cart	Change quantity to valid number	Quantity updates correctly	High
TC-03	Create new account	User on registration page	Enter valid info → submit	Account created successfully	High
TC-04	Navigate to category	User on homepage	Click category link	Category page loads	Medium
TC-05	View account details	User logged in	Go to account page	Account info displays	Medium
TC-06	Search invalid product	User on homepage	Enter invalid product → search	No results message shown	Medium
TC-07	Duplicate account	Existing account exists	Enter duplicate email → submit	Error prevents creation	High
TC-08	Exceed quantity limit	Item in cart	Enter quantity >10	Error shown, not allowed	High
TC-09	Missing account fields	User on registration page	Leave fields blank → submit	Validation errors appear	High
TC-10	Invalid email login	User on login page	Enter bad email format → submit	Login blocked with error	High

Edge Cases:

Test ID	Test Scenario	Preqs	Test Steps	Expected Result	Priority
EC-01	Extremely long search term	User on homepage	Enter very long text (200+ chars) → search	System handles input without crashing or breaking UI	Medium
EC-02	Refresh during checkout	Item in cart, user in checkout	Proceed to checkout → refresh page	Checkout state is preserved OR safely reset without errors	High
EC-03	Product at stock limit	Product stock = exact quantity available	Add max available quantity to cart	System allows exact amount but blocks anything above	High

Edge Case Test Summary

Edge case testing was performed on key areas of the application, including search functionality, checkout flow, and product stock validation.

- The system successfully handled an **extremely long search term** without crashing or breaking the UI.
- The application behaved as expected when the page was **refreshed during checkout**, maintaining a stable and recoverable state.
- However, a defect was identified in the **product stock validation**.

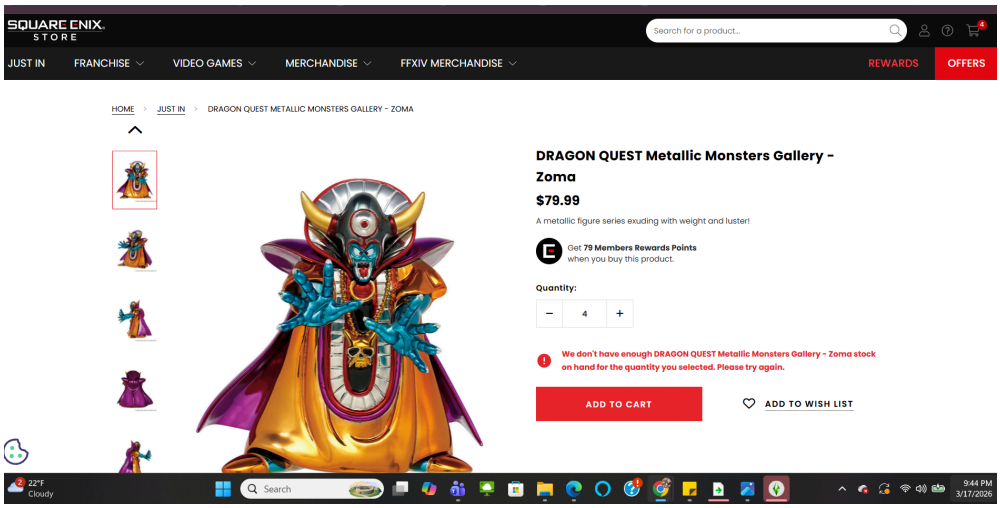
The system allowed a user to add a quantity **beyond the available stock limit**, which should not be permitted. This indicates a gap in validation logic for enforcing stock constraints.

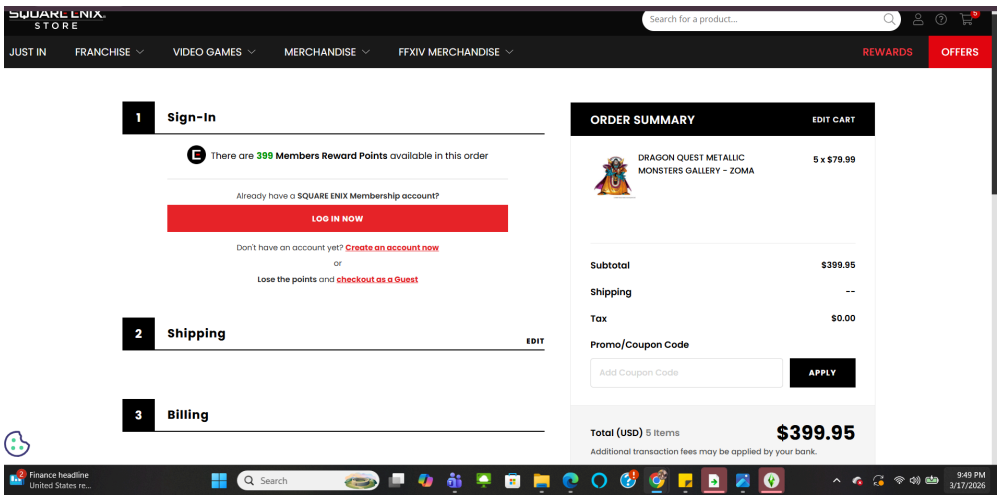
Bug ID	Title	Preqs	Steps to Reproduce	Expected Result	Actual Result	Severity	Priority	Status
BUG-001	Allows quantity beyond stock limit	Product stock is set (e.g., 10 units)	1. Go to product page 2. Add item to cart 3. Enter quantity greater than stock (e.g., 11) 4. Update cart	System should block quantity above stock and show error	System allows quantity above stock with no error	High	High	Open

Bug Report Summary

During edge case testing, a defect was identified in the product stock validation logic. The system failed to enforce the maximum available stock limit, allowing users to input and update quantities beyond what is available.

This issue can lead to incorrect orders, potential inventory mismatches, and a negative user experience. The defect indicates that validation checks for stock constraints are either missing or not functioning as expected.





Final Test Conclusion

Testing was conducted across positive scenarios, negative scenarios, and key edge cases for the Square Enix store application.

- Core functionalities such as search, account creation, navigation, and cart updates performed as expected.
- Negative scenarios confirmed that validation messaging and error handling are mostly functioning correctly.
- Edge case testing showed that the system is generally stable under unusual conditions.

However, a **critical defect** was identified in stock validation, where users were able to exceed the available product quantity. This issue should be prioritized for resolution before production release.

Overall Assessment:
The application is functionally stable in most areas, but requires fixes to stock validation logic to ensure data accuracy and prevent user-facing issues.
